

1. What exactly are we making?

An Agricultural Market Decision-Intelligence Layer for farmers/FPOs.

It will take a crop lot and answer:

“Where, when, and how should I sell this lot to get the best risk-adjusted return?”

It will compare:

Different mandis/buyers

Current & predicted prices

Transport cost

Storage cost

Buyer reliability

Quality

Quantity

Farmer/FPO's cash/urgency requirement

Output: Sell Now / Store / Change Market /

Aggregate / Split Lot with the best option ranked.

2. How will we do that?

Flow:

Farmer/FPO → Create Crop Lot → Collect Market Data → Find Selling Options → Check Constraints → Calculate Net Realization → Price Forecast → Risk Analysis → Optimization → Recommendation

Data comes from:

Government open datasets like AGMARKNET/
data.gov.in

e-NAM/MSAMB when authorized integration is available

Buyer/FPO data entered into our system

Logistics/storage information

Then our AI/ML + optimization engine calculates the best strategy.

3. How will quality checking work?

We will NOT claim that our software physically tests the crop.

Actual flow:

Farmer/FP0 → Authorized APMC/Assaying
Lab → Physical Quality Test → Quality Report/
Certificate → Our Software → Lot ID

The authorized facility checks parameters
such as:

Moisture

Foreign matter

Damaged produce

Commodity-specific quality parameters

Grade

Our software will store/link/verify the quality
report with the crop Lot ID.

Example:

LOT001

Soybean

Grade: A

Moisture: 11.2%

Certificate: QA-00125

Status: Certified

If no official certificate exists:

Status: Self-declared

AI/image analysis can be used only as preliminary estimation, not official certification.

4. How will we use existing apps/platforms, and what do we do afterward?

We don't replace e-NAM/MSAMB/AGMARKNET.

Think:

Existing Platforms

DATA / SERVICES

OUR INTEGRATION LAYER

DATA NORMALIZATION

AI + FORECASTING

OPTIMIZATION ENGINE

BEST SELLING STRATEGY

Farmer/FPO Decision

Execute through appropriate
existing platform/buyer

For example, existing systems may give us:

Mandi A = ₹5,000/q

Mandi B = ₹5,200/q

Arrivals = X

Quality information = Y

We don't stop there.

We combine that with:

Transport + storage + forecast + buyer
reliability + farmer constraints
and produce:

“For this particular 100-tonne lot, selling to
Buyer B gives the best expected realization;

alternatively, store 40 tonnes for 7 days.”

In one sentence:

Existing platforms provide the agricultural market infrastructure/data; our software converts that fragmented information into an actionable, personalized selling decision.
